

LENS MARKING AND TESTING EQUIPMENT

M611  
Axis Marker

M621  
Colmascope

THE M611 Axis Marker is a practical appliance for centering and marking lenses of all kinds. The axis chart has a prism scale, making it possible to measure prisms, and to determine the amount of decentration of lens.

The sliding target, to which the light is secured, is adjustable for very weak or very strong powers. The electric illumination gives an even light on the scale, eliminating the possibility of error in marking.

The forward legs are hinged, enabling the operator to set the instrument in a natural position on a table or bench as shown in the cut, or to fold up the legs and lay the instrument flat when using in a high position.

Regularly finished in black Frostol and shipped complete, assembled ready for use.

The M621 Colmascope provides a practical way of testing mounted lenses for strain. Frequently Rx jobs when sent through the mails, are received broken, in spite of careful packing. Yet the work was apparently in perfect condition when mailed. Such annoyance and loss represents a considerable item in the course of a year's business.

To test lenses for strain under these conditions, AOCo. devised the Colmascope. This instrument is thoroughly scientific in its principles of light control. With it the nature of the strain is indicated clearly, whether caused physically by defective annealing in the glass itself, or mechanically by over-tightening in the frame or mounting.

Catalog Number	Description	Price Each
M611	AXIS MARKER . . . . . Gross weight, 25 lbs.; net weight, 11½ lbs. Complete with electric light and cord. Code word, <i>Gemcent</i>  Note.—Specify whether for use on 110 or 200 voltage.	\$25.00
